

# Lower limb revascularisation for peripheral arterial disease to prevent limb loss

Peripheral arterial disease (PAD) is a restriction of the blood flow in the lower limb arteries that can severely affect a patient's quality of life, and risk their limb.

Open and endovascular interventions are options when conservative therapies have proved to be ineffective.

## Patient characteristics in 2021

54% of patients admitted with CLTI had their bypass within 5 days, which is the recommended time

However for 9/64 vascular units, 25% of patients waited more than 10 days

In the NVR data, CLTI is defined as patients admitted in an emergency with either resting pain or necrosis and/or gangrene.

## Glossary

The average is the median; "typical range" is the interquartile range.

Chronic limb-threatening ischaemia (CLTI) is the most severe form of PAD, where the blood flow to the legs becomes severely restricted.

## Patient Outcomes
